

教材6: 最高点の生徒を探そう

```
from openpyxl import load_workbook

wb = load_workbook("score.xlsx")
ws = wb.active

max_score = 0
max_name = ""

for row in range(2, ws.max_row + 1):

    name = ws.cell(row=row, column=1).value
    score = ws.cell(row=row, column=2).value

    if score > max_score:
        max_score = score
        max_name = name

print("最高得点")
print(max_name, max_score)
```

この教材では「最大値探索アルゴリズム」をExcelデータで体験できます。

教材7: 条件に合う生徒だけを抽出しよう

「80点以上の生徒」を別シートに一覧表示します。

```
from openpyxl import load_workbook

wb = load_workbook("score.xlsx")

ws = wb.active
ws2 = wb.create_sheet("80点以上")

ws2["A1"] = "名前"
ws2["B1"] = "点数"

new_row = 2

for row in range(2, ws.max_row + 1):
    name = ws.cell(row=row, column=1).value
    score = ws.cell(row=row, column=2).value

    if score >= 80:
```

```
ws2.cell(row=new_row, column=1).value = name
ws2.cell(row=new_row, column=2).value = score

new_row += 1

wb.save("high_score.xlsx")
```

教材8: 点数によってセルの色を変えよう

例えば、

- 80点以上 → 緑
- 60～79点 → 黄色
- 59点以下 → 赤

とします。

```
from openpyxl import load_workbook

from openpyxl.styles import PatternFill
```

```
wb = load_workbook("score.xlsx")
```

```
ws = wb.active
```

```
green = PatternFill(
```

```
    fill_type="solid",
```

```
    fgColor="90EE90"
```

```
)
```

```
yellow = PatternFill(
```

```
    fill_type="solid",
```

```
    fgColor="FFFF00"
```

```
)
```

```
red = PatternFill(
```

```
    fill_type="solid",
```

```

        fgColor="FF9999"
    )

for row in range(2, ws.max_row + 1):

    cell = ws.cell(row=row, column=2)

    score = cell.value

    if score >= 80:

        cell.fill = green

    elif score >= 60:

        cell.fill = yellow

    else:

        cell.fill = red

wb.save("color_score.xlsx")

```

if → elif → else がポイント

教材9: PythonからExcelグラフを作ろう

```

from openpyxl import load_workbook
from openpyxl.chart import BarChart, Reference

```

```

wb = load_workbook("score.xlsx")
ws = wb.active

```

```

chart = BarChart()

```

```

data = Reference(
    ws,
    min_col=2,
    min_row=1,

```

```

        max_row=ws.max_row
    )

    categories = Reference(
        ws,
        min_col=1,
        min_row=2,
        max_row=ws.max_row
    )

    chart.add_data(data, titles_from_data=True)
    chart.set_categories(categories)

    chart.title = "テスト結果"
    chart.y_axis.title = "点数"
    chart.x_axis.title = "名前"

    ws.add_chart(chart, "D2")

    wb.save("score_chart.xlsx")

```

Pythonを実行

↓

Excelを開く

↓

グラフまで完成

教材10: お店の商品別売上を集計しよう

最後は実務に近づけます。

元データ:

商品	個 数	単 価
りんご	3	150

バナ	5	100
ナ		

りんご	2	150
-----	---	-----

みか	4	120
ん		

バナ	3	100
ナ		

これを商品ごとに集計します。

```
from openpyxl import load_workbook
```

```
wb = load_workbook("sales.xlsx")
```

```
ws = wb.active
```

```
sales = {}
```

```
for row in range(2, ws.max_row + 1):
```

```
    product = ws.cell(row=row, column=1).value
```

```
    count = ws.cell(row=row, column=2).value
```

```
    price = ws.cell(row=row, column=3).value
```

```
    amount = count * price
```

```
    if product in sales:
```

```
        sales[product] += amount
```

```
    else:
```

```
        sales[product] = amount
```

```
ws2 = wb.create_sheet("商品別売上")
```

```
ws2["A1"] = "商品"
```

```
ws2["B1"] = "売上"
```

```
row = 2
```

for product in sales:

ws2.cell(row=row, column=1).value = product

ws2.cell(row=row, column=2).value = sales[product]

row += 1

wb.save("sales_result.xlsx")

実際の業務システムに近い処理
